* Concentrations satisfy directly measured 95% confidence intervals of both AG and concentrations. [c] and [m] denote values consistent with reaction free energies in cytosol and mitochondria, respectively.

** CO2 concentration was calculated using Henry's law at the respective culture conditions. Coenzyme A and phosphate concentrations were taken from literature.

Supplementary Table 4. Reaction free energies (ΔG) consistent with directly measured metabolite concentrations.

* Concentrations satisfy both measured 95% confidence interval and thermodynamic constraints. [c] and [m] denote values consistent with reaction free energies in cytosol and mitochondria, respectively.

** CO2 concentration was calculated using Henry's law at the respective culture conditions. Coenzyme A and phosphate concentrations were taken from literature.

*** Hexose-phosphate includes glucose-6-phosphate and fructose-6-phosphate. Pentose-phosphate includes ribose-5-phosphate, ribulose-6-phosphate, and xylulose-5-phosphate.

Supplementary Table 6. Reactions included in ^{13}C -metabolic flux analysis.

Supplementary Figure 1. Conservation of absolute metabolite concentrations.

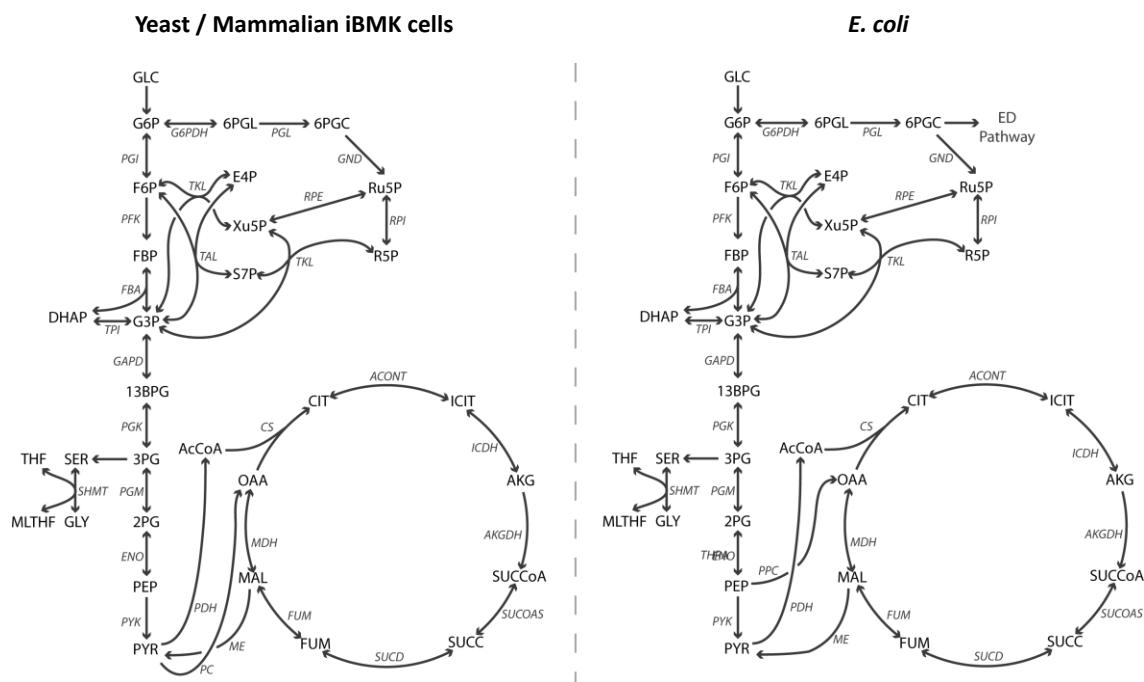

Comparison of absolute metabolite concentrations across organisms. Plotted data are for all measured metabolites. Error bars represent 95% confidence intervals.

Supplementary Figure 2. ATP, NAD⁺, and NADPH but not NADP⁺ saturate both active and regulatory binding sites. Comparison of absolute metabolite concentrations (Y-axis) to enzyme binding site affinities (X-axis). Hollow circles show concentration- K_m pairs and filled circles show concentration- K_i pairs for *E. coli*, yeast, and mammalian iBMK cells.

Supplementary Figure 3. Comparison of metabolite levels in *E. coli* liquid and filter cultures. Ion counts of (a) all metabolites and (b) metabolites involved in central carbon metabolism. To determine filter culture density, the cells on the filter (47 mm diameter) were washed into 3 ml of sterile liquid media.

Supplementary Figure 4. Central carbon metabolic network used for integrative computation of concentrations and free energies. These reaction networks include several metabolites and reactions whose concentrations and free energy changes cannot be directly measured yet can be inferred using the direct measurements of other observed absolute metabolite concentrations and reaction free energies.

Supplementary Data Set 1. Steady-state metabolite labeling from various ^{13}C -tracers.

Labeling of cellular metabolites in *E. coli* and yeast from [1,2- $^{13}\text{C}_2$]-glucose, [3- $^{13}\text{C}_1$]-glucose, and a 1:1 mix of unlabeled and [U - $^{13}\text{C}_6$]-glucose, and in mammalian iBMK cells from [1,2- $^{13}\text{C}_2$]-glucose, [U - $^{13}\text{C}_6$]-glucose, and [U - $^{13}\text{C}_5$]-glutamine.

Supplementary Data Set 2. Comparison of absolute concentrations to enzyme binding site affinities for substrates. K_m values in *E. coli*, *S. cerevisiae*, *Mus musculus*, and *Homo sapiens* were extracted from BRENDA. The parameters for mammalian cells are from enzymes in *Mus musculus* whenever possible, but otherwise in *Homo sapiens*. When multiple entries for the same enzyme-metabolite pair were available, its K_m was represented by their geometric mean.

Supplementary Data Set 3. Comparison of absolute concentrations to enzyme binding site affinities for inhibitors. K_i values in *E. coli*, *S. cerevisiae*, *Mus musculus*, and *Homo sapiens* were extracted from BRENDA. The parameters for mammalian cells are from enzymes in *Mus musculus* whenever possible, but otherwise in *Homo sapiens*. When multiple entries for the same enzyme-metabolite pair were available, its K_i was represented by their geometric mean.
